

Pronttera — Digital Marketing Agency Management Platform

Full Frontend Architecture + Supabase Backend Structure (v2 — merged with full module research)

This version merges your original module list with the fuller ChatGPT breakdown you shared (CRM/Lead pipeline, SEO, Email Marketing, Integrations, and the "ClickUp/Monday for agencies" extras). Structured in **phases** so you build an MVP first and layer on the SaaS-level features later.

1. Portal Structure

Portal	Who	Core Job
Agency Portal	Manager, Team Members	Run projects, manage clients, campaigns, budgets, leads
Client Portal	Client role	View progress, approve creatives, raise tickets, view invoices/reports
IT/Ops Console	Manager + IT role	Users, audit logs, integrations, system health

One Next.js codebase, one Supabase project, separated by role-based route groups + RLS — not three separate apps.

2. Roles (merged list)

From your two sources, roles collapse into these for RLS purposes, with job titles as a "display role" on top:

RLS Role (enum)	Maps to job titles
manager	Super Admin, Agency Owner, Marketing Manager, Project Manager
team_member	SEO Executive, PPC Specialist, Social Media Manager, Content Writer, Graphic Designer, Video Editor, Sales Executive
client	Client (read + approve only)
it_admin	IT/ops staff (optional 4th role)

Keep `profiles.role` to these 4 for policies; add a separate `profiles.job_title` free-text/enum column purely for display and task filtering — don't write RLS against job titles, it doesn't scale.

3. Modules — Full List by Phase

Phase 1 (MVP — build first)

- Dashboard (KPIs, overdue tasks, recent activity)
- Client Management (details, contacts, contracts, documents)
- Project Management (3 types: DM / Social / PPC — see your original list)
- Task Management + Kanban Board
- Content Calendar + Client Calendar
- Social Media Management (scheduling, approvals)
- PPC Management (Google/Meta Ads, budgets, ROAS)
- Creative Asset Library
- Budget Management
- Tickets
- Invoices & Billing
- Status Tracking (shared enum system)
- Users & Roles
- Notifications (in-app + email)
- Audit Logs

Phase 2 (CRM & full-funnel — high value, agency-specific)

- **Lead Management (CRM)** — capture, assign, qualify, convert
- **Sales Pipeline** — New Lead → Contacted → Qualified → Proposal Sent → Negotiation → Won/Lost
- **SEO Management** — keywords, rankings, backlinks, technical audits
- **Email Marketing** — campaigns, newsletters, automation
- **Reports & Analytics** — cross-module, exportable, client-scoped views
- **Integrations** — Google Analytics, Search Console, Meta, LinkedIn, Mailchimp, HubSpot

Phase 3 (SaaS-level differentiators — "ClickUp/Monday for agencies")

- Brand Management (brand guidelines, logos, fonts, colors per client)
- Competitor Analysis
- Keyword Research tool
- AI Content Generator / AI Ad Copy Generator
- White-label Reporting (branded PDF/portal per client)
- Media Buying Management
- UTM Builder
- Landing Page Management
- Marketing Automation Workflows
- KPI & Goal Tracking
- Risk Management / Change Requests (borrowed from the general PM version — useful for scope-creep control on retainer projects)

Build Phase 1 fully, get a client-facing pilot live, then layer Phase 2/3 in based on which clients actually push for CRM vs SEO vs automation — don't build all of Phase 3 speculatively.

4. Statuses (standardize these as Postgres enums/check constraints)

Project statuses: Draft → Planning → Approved → In Progress → On Hold → Blocked → Under Review → Completed → Cancelled

Task statuses: Backlog → To Do → In Progress → In Review → QA/Approval → Done → Reopened → Blocked

Campaign statuses: Draft → Planned → Pending Client Approval → Scheduled → Active → Paused → Optimizing → Completed → Cancelled

Lead pipeline: New Lead → Contacted → Qualified → Proposal Sent → Negotiation → Won / Lost

Ticket statuses: Open → In Progress → Resolved → Closed

Invoice statuses: Draft → Sent → Paid → Overdue

Keep every status list in one `lib/constants/statuses.ts` file on the frontend and mirrored as Postgres `check` constraints — this is what powers the "Status Tracking" module as a cross-cutting concern rather than its own screen.

5. Dashboard Widgets (merged)

Total Clients · Active Projects/Campaigns · Delayed Projects · Completed Projects · Upcoming Deadlines · Monthly Leads · Conversion Rate · Ad Spend · Revenue Generated · ROAS · SEO Ranking Changes · Organic Traffic · Social Media Reach · Engagement Rate · Scheduled Posts · Pending Approvals · Team Workload · Open Tickets · High Priority Tasks · Time Logged This Week

Build this as a config-driven widget grid (array of widget definitions with a data-fetcher function each) so adding/removing widgets per role doesn't require new page code.

6. Tech Stack

- **Framework:** Next.js 14+ (App Router)
- **Styling:** Tailwind CSS + shadcn/ui
- **Data fetching/cache:** TanStack Query
- **Forms:** React Hook Form + Zod
- **Kanban:** `@dnd-kit`
- **Calendar:** FullCalendar (React)
- **Charts/Analytics:** Tremor or Recharts
- **Email marketing sends:** Resend or Postmark (transactional) — don't try to build a Mailchimp clone, integrate with Mailchimp/Brevo for actual campaign sending in Phase 2
- **Storage:** Supabase Storage (see your \$25 Pro plan → 100GB included, \$0.0213/GB after)
- **Auth:** Supabase Auth
- **PDF (invoices, white-label reports):** react-pdf or Supabase Edge Function

7. Folder Structure (Next.js App Router)

```

8. Supabase Schema — Core + Phase 2 Additions

Core tables (unchanged from before): profiles, clients, client_documents, projects, project_members, tasks, milestones, calendar_events, social_posts, ppc_campaigns, creative_assets, budgets, tickets, invoices, audit_logs.

New Phase 2 tables:

```
sql
```

```
-- LEAD MANAGEMENT / CRM
leads (
  id uuid primary key default gen_random_uuid(),
  name text,
  company text,
  email text,
  phone text,
  source text,          -- website, referral, ad, cold outreach
  stage text check (stage in ('new','contacted','qualified','proposal_sent',''),
  assigned_to uuid references profiles(id),
  estimated_value numeric,
  converted_client_id uuid references clients(id),  -- filled when Won
  created_at timestampz default now()
)

lead_activities (
  id uuid primary key default gen_random_uuid(),
  lead_id uuid references leads(id),
  activity_type text,    -- call, email, meeting, note
  notes text,
  logged_by uuid references profiles(id),
  created_at timestampz default now()
)

-- SEO MANAGEMENT
seo_keywords (
  id uuid primary key default gen_random_uuid(),
  project_id uuid references projects(id),
  keyword text,
  target_url text,
  current_rank int,
  previous_rank int,
  search_volume int,
  tracked_since date default now()
)

seo_audits (
  id uuid primary key default gen_random_uuid(),
  project_id uuid references projects(id),
  audit_date date,
  issues jsonb,          -- structured list of technical SEO issues
  score int
)

-- EMAIL MARKETING
email_campaigns (
  id uuid primary key default gen_random_uuid(),
  project_id uuid references projects(id),
  name text,
  subject_line text,
  status text default 'draft',
  scheduled_at timestampz,
  sent_count int default 0,
  open_rate numeric,
  click_rate numeric
)

-- INTEGRATIONS (per client, credentials stored via Supabase Vault, not plain text)
integrations (
  id uuid primary key default gen_random_uuid(),
  client_id uuid references clients(id),
  provider text check (provider in ('google_analytics','search_console','meta_tag_manager')),
  status text default 'connected',
  last_synced_at timestampz,
  created_at timestampz default now()
)
```

Store OAuth tokens/API keys via **Supabase Vault** (`vault.secrets`), not plain table columns — this matters for the Integrations module especially.

9. RLS Pattern (unchanged principle, extend to new tables)

Every client-scoped table gets the same two-branch policy: `(client)` role sees only rows matching their `(client_org_id)`; `(manager)`/`(team_member)` see rows they're scoped to via `(project_members)` or unrestricted for managers. Apply this identically to `(leads)`, `(seo_keywords)`, `(email_campaigns)` — leads are the one exception, since they belong to the agency, not a client, until converted, so scope those by `(assigned_to)` + manager override instead of `(client_org_id)`.

10. Supabase Storage Cost Note (from your pricing question)

On the \$25/mo Pro plan: **100 GB storage included**, \$0.0213/GB after that, 250 GB egress/month included. For a creative asset library with video content, egress is usually the first thing to watch — not storage. Budget for it if clients will be downloading large video assets frequently.

11. Suggested Build Order

- 1. Auth + roles + RLS skeleton
- 2. Client Management + Users
- 3. Projects (3 types) + Kanban + Tasks
- 4. Tickets + Invoices
- 5. Calendar + Social + PPC
- 6. Creative Asset Library + Budget
- 7. Reports/Analytics (Phase 1 version — simple rollups)
- 8. Audit Logs + IT console
- 9. **Phase 2:** Lead Management/CRM + Sales Pipeline
- 10. **Phase 2:** SEO + Email Marketing + Integrations
- 11. **Phase 3:** pick 2-3 differentiators based on client demand (white-label reporting and UTM builder are usually the highest-ROI first picks)

Merged from your original module list + the full ChatGPT chat content you pasted (general PM system modules + digital marketing agency modules + the "ClickUp/Monday for agencies" extras).
